DETAILED ACTION

Allowable Subject Matter

1. Claims 1-32 and 72-79 allowed.
2. Claims 34-41, 43-53, 55-62, and 64-71 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

4. Claims 33, 42, 54, 63, rejected under 35 U.S.C. 103(a) as being unpatentable over King (2004/0246764) in view of Herner et al. (2005/0098800).

Regarding Claims 33, 42, 54 and 63, King discloses a memory cell utilizing negative differential resistance devices where negative differential resistance devices 130 which is disclosed also to be a diode negative differential resistance diode device, is located between the Vdd node and the Vsn node, i.e. between the second diffusion region of the transistor 110 and the reference potential. Furthermore, paragraph 46 discloses that memory cell could be built on a SOI structure. King fails to disclose the intrinsic region of the negative differential diode 130. However, Herner et al. disclose a non-

volatile memory cell comprising a reduced height vertical diode where in paragraph 35, the required intrinsic region is disclosed.

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required intrinsic region in King as taught by Herner et al. in order to have a semiconductor device with smaller geometry and operable with a lower voltage value.
